

EXERCISE 4. a) solution

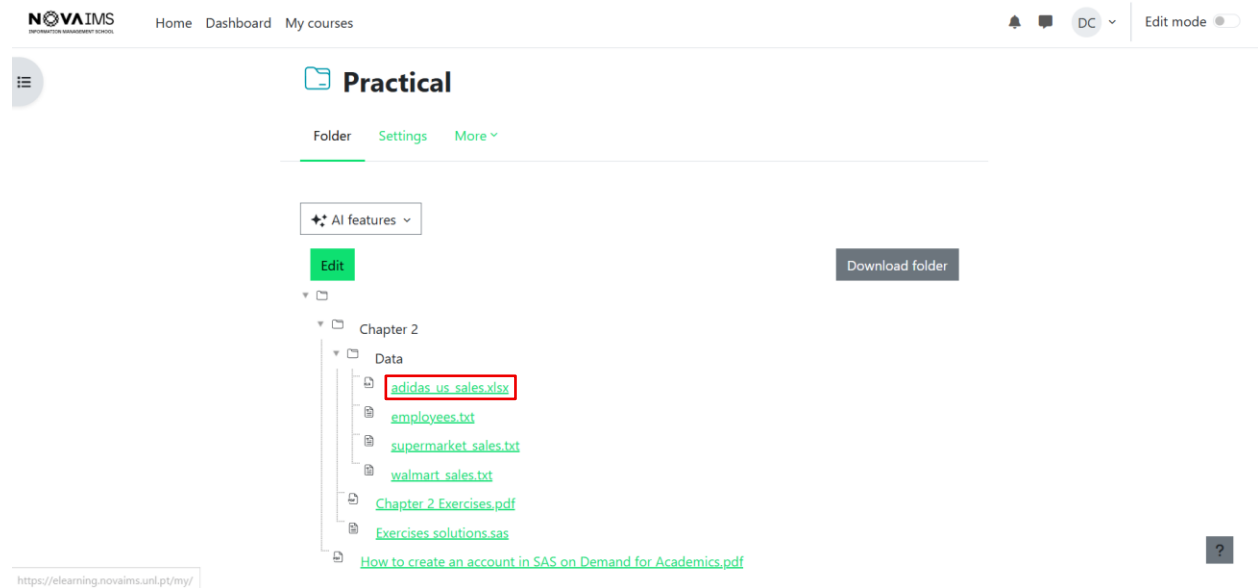

Teachers: Catarina Neves

(cneves@novaims.unl.pt)

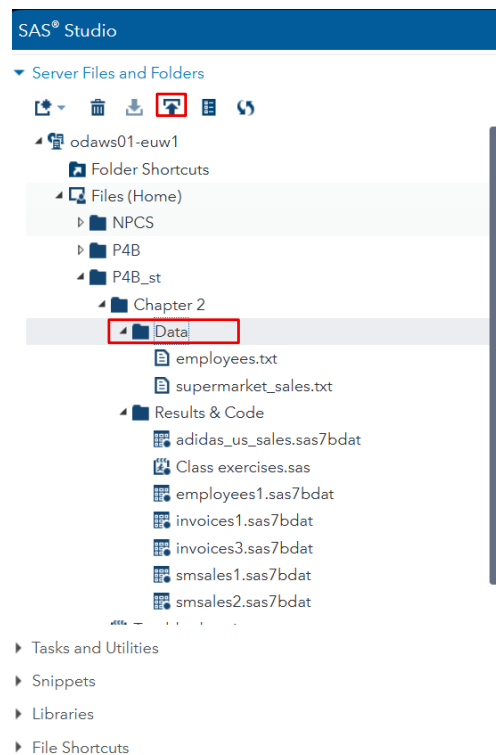

Daniel Caridade

(dcaridade@novaims.unl.pt)

STEP 1 – Download the *adidas_us_sales.xlsx* dataset from Moodle.

STEP 2 – Click on the folder you want to save the *adidas_us_sales.xlsx* file and click on the upload button.

STEP 3 – Click on choose files.

Upload Files

Upload files to:

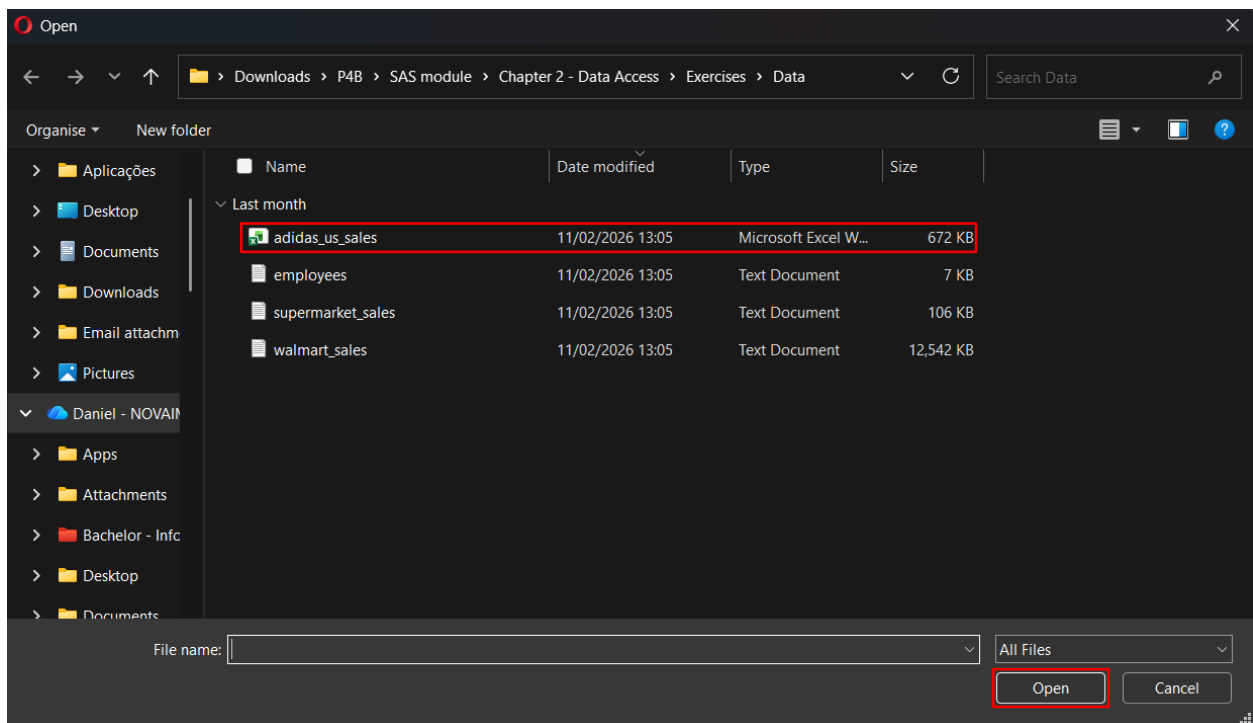

/home/u64191330/P4B_st/Chapter 2/Data

Choose Files

Upload

Cancel

STEP 4 – Select the *adidas_us_sales.xlsx* and click on Open.

STEP 5 – Click on Upload.

Upload Files

Upload files to:

/home/u64191330/P4B_st/Chapter 2/Data

Choose Files

Selected files:

1

XLSX

adidas_us_sales.xlsx

671.7 kb

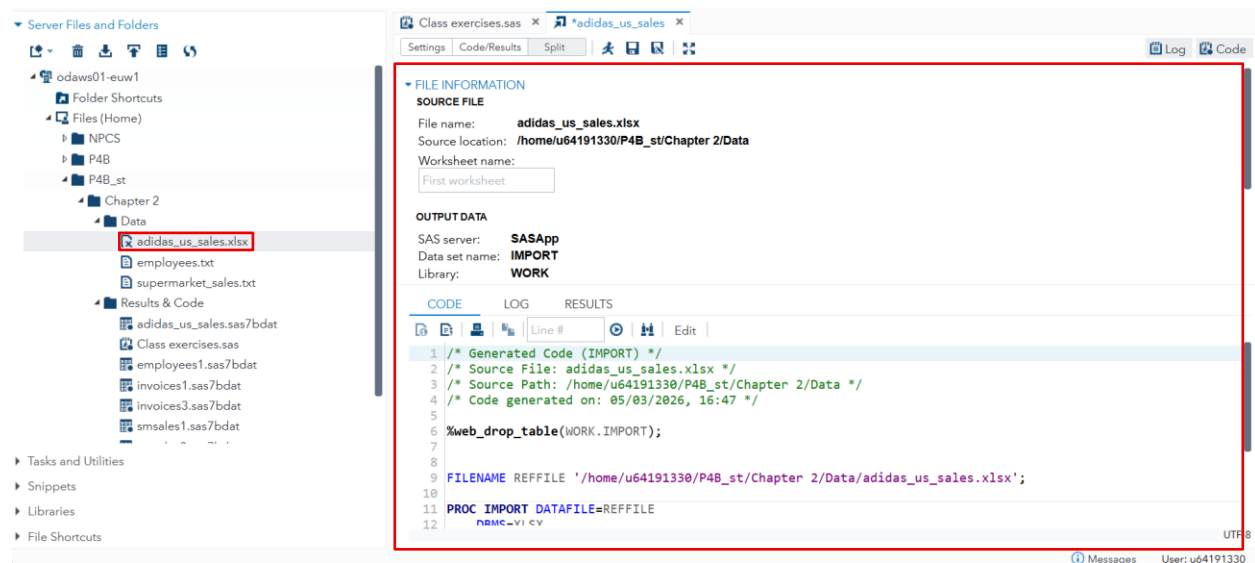

Upload

Cancel

STEP 6 – From this point onward, there are two ways you can use to complete the exercise, both will be presented by you only need to choose one.

Option 1: Fastest option

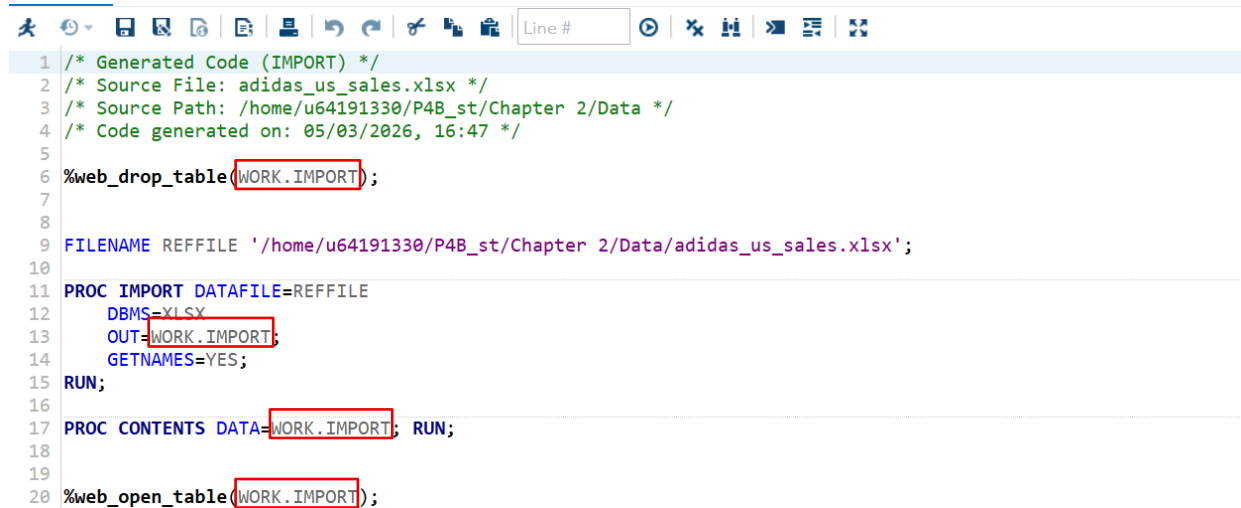

STEP 6.1.1 - Double click on your file and a new tab will appear with file information and a code that was generated automatically as you can see below:

STEP 6.1.2 - After this click on the Edit button close to the binoculars.

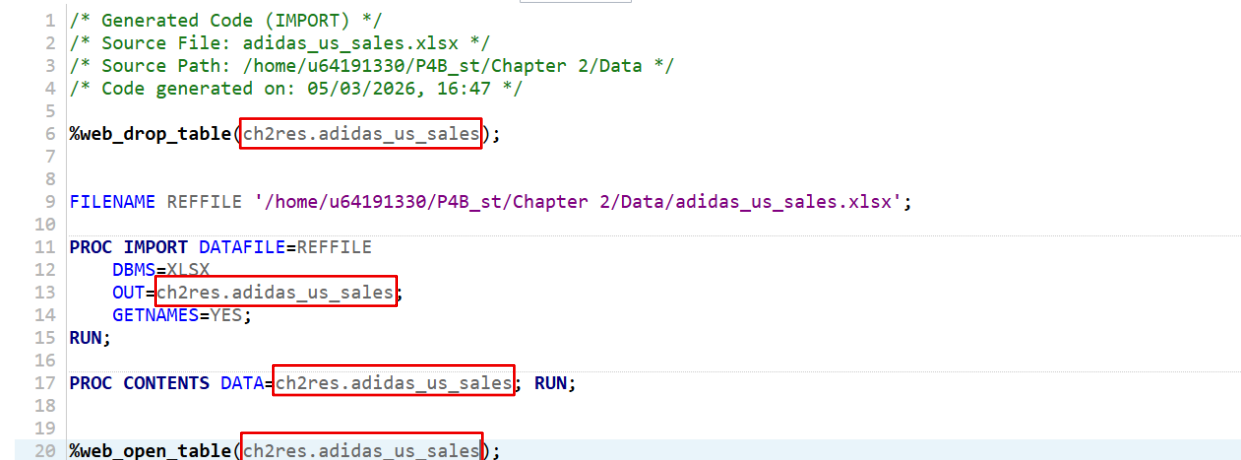

STEP 6.1.3 - After this you are now capable of editing the code that was automatically generated by SAS due to the Import Wizard procedure. As the exercise ask us to save the file as *adidas_us_sales* we need to change the parts in which WORK.IMPORT to the name of the library where you store the results (in classes we have been using ch2res followed by a dot and *adidas_us_sales*).

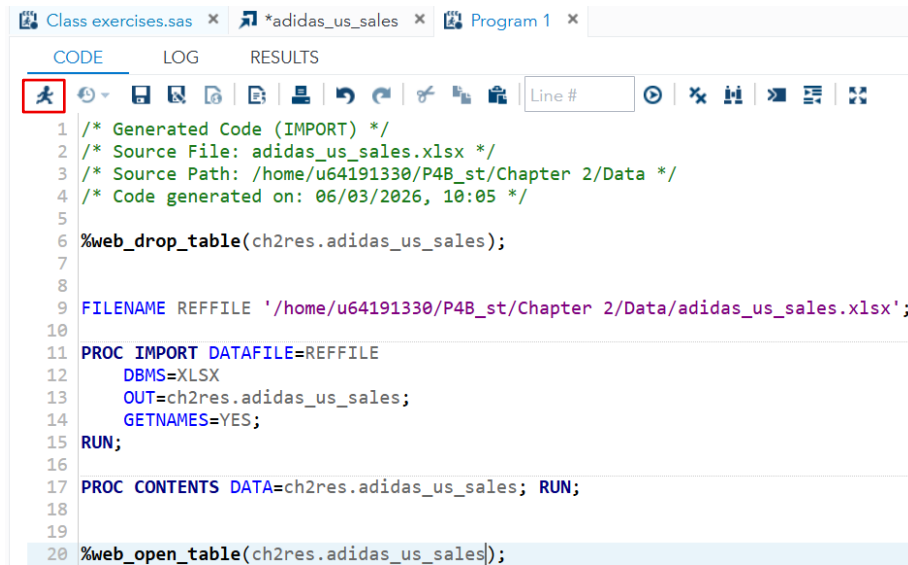

```
1 /* Generated Code (IMPORT) */
2 /* Source File: adidas_us_sales.xlsx */
3 /* Source Path: /home/u64191330/P4B_st/Chapter 2/Data */
4 /* Code generated on: 05/03/2026, 16:47 */
5
6 %web_drop_table(WORK.IMPORT);
7
8
9 FILENAME REFFILE '/home/u64191330/P4B_st/Chapter 2/Data/adidas_us_sales.xlsx';
10
11 PROC IMPORT DATAFILE=REFFILE
12     DBMS=XLSX
13     OUT=WORK.IMPORT;
14     GETNAMES=YES;
15 RUN;
16
17 PROC CONTENTS DATA=WORK.IMPORT; RUN;
18
19
20 %web_open_table(WORK.IMPORT);
```

After doing the changes your code should be something like this:

```
1 /* Generated Code (IMPORT) */
2 /* Source File: adidas_us_sales.xlsx */
3 /* Source Path: /home/u64191330/P4B_st/Chapter 2/Data */
4 /* Code generated on: 05/03/2026, 16:47 */
5
6 %web_drop_table(ch2res.adidas_us_sales);
7
8
9 FILENAME REFFILE '/home/u64191330/P4B_st/Chapter 2/Data/adidas_us_sales.xlsx';
10
11 PROC IMPORT DATAFILE=REFFILE
12     DBMS=XLSX
13     OUT=ch2res.adidas_us_sales;
14     GETNAMES=YES;
15 RUN;
16
17 PROC CONTENTS DATA=ch2res.adidas_us_sales; RUN;
18
19
20 %web_open_table(ch2res.adidas_us_sales);
```

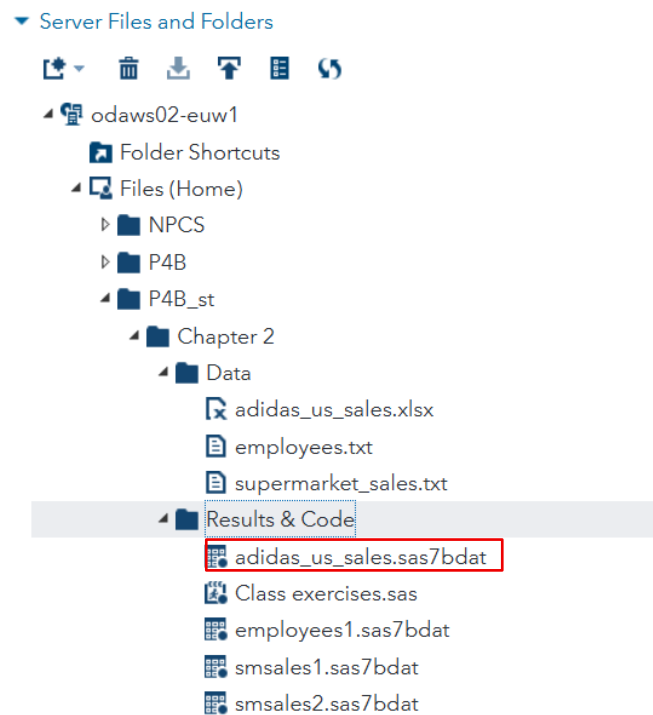

STEP 6.1.4 – Click on the Run button.

The screenshot shows the SAS Studio interface with three tabs: 'Class exercises.sas', '*adidas_us_sales', and 'Program 1'. The 'CODE' tab is active, displaying the following SAS code:

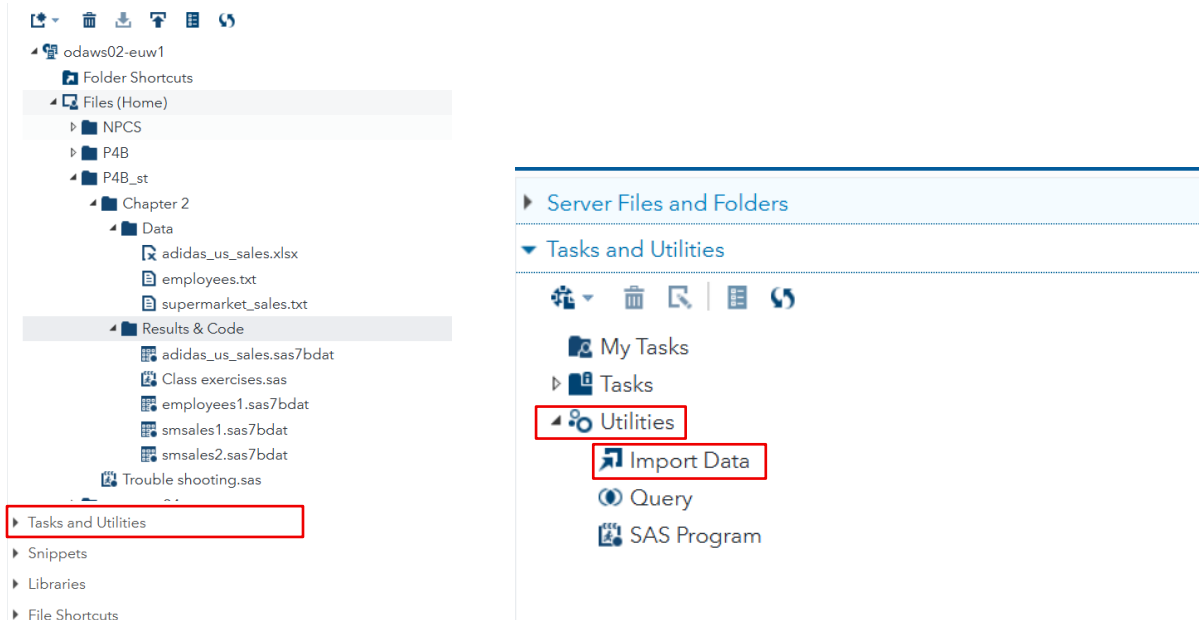

```
1 /* Generated Code (IMPORT) */
2 /* Source File: adidas_us_sales.xlsx */
3 /* Source Path: /home/u64191330/P4B_st/Chapter 2/Data */
4 /* Code generated on: 06/03/2026, 10:05 */
5
6 %web_drop_table(ch2res.adidas_us_sales);
7
8
9 FILENAME REFFILE '/home/u64191330/P4B_st/Chapter 2/Data/adidas_us_sales.xlsx';
10
11 PROC IMPORT DATAFILE=REFFILE
12     DBMS=XLSX
13     OUT=ch2res.adidas_us_sales;
14     GETNAMES=YES;
15 RUN;
16
17 PROC CONTENTS DATA=ch2res.adidas_us_sales; RUN;
18
19
20 %web_open_table(ch2res.adidas_us_sales);
```

After this you should be capable of seeing the `adidas_us_sales` created in the folder assigned to the library `ch2res`.

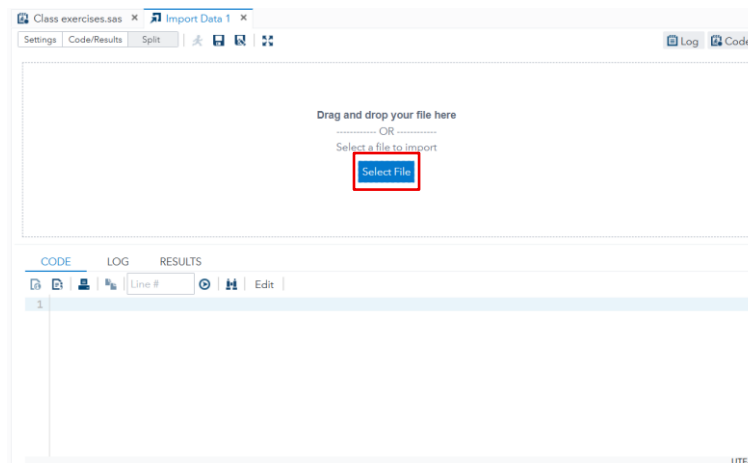

Option 2: Slower option

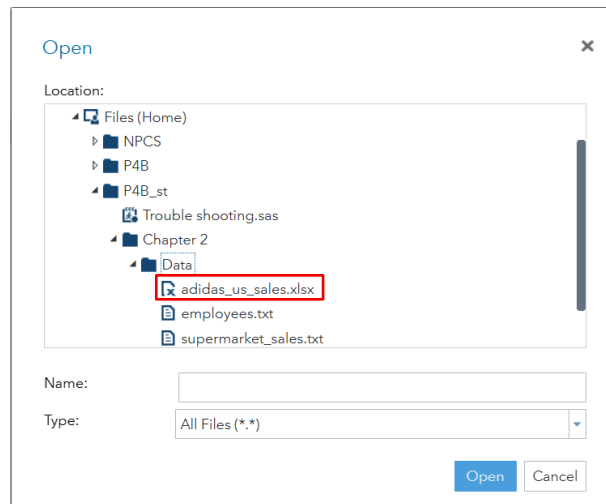

STEP 6.2.1 – On the navigation panel click on Task and Utilities, then click on utilities this will show all the SAS built in utilities. Finally click on Import Data.

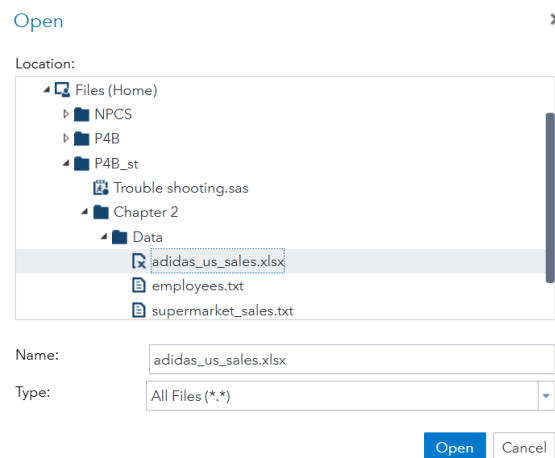

STEP 6.2.2 – After clicking on import Data, a new tab called import data will be displayed, then click on Select file.

STEP 6.2.3 – After this, find the *adidas_us_sales.xlsx* file that should be inside of Files (Home) and in the folder on SAS where you add uploaded it on step 5.

STEP 6.2.4 – After clicking on the *adidas_us_sales.xlsx* file, click on Open to generate a page like the one you can see from 6.1.1.

STEP 6.2.5 – Repeat the steps on 6.1.2 to 6.1.4 and then the exercise is solved.
