5. PRODUCTION OF REPORTS

EXERCISE 1

Consider the *mydata.smsales* data set, which contains the *supermarket_sales.txt* data as described in Exercise 1.

- a) Produce a report on the sales transactions (variables: *Invoice_ID*, *Date*, *Total* and *Rating*) such that:
 - The column that numbers the observations is not displayed;
 - The number of observations is indicated at the end of the listing;
 - Assign to each variable an appropriate label.
- b) Adapt the Proc Step of the previous paragraph to produce a report such that:
 - It includes the *Branch* variable in a column to the left of the listing;
 - It only includes observations on sales transactions from branches A and C;
 - It has the title *Listing of Sales Transactions for Branches A and C*, and the footnote *Generated by Data Analytics System*.
- c) Produce a report on the sales transactions (variables: *Invoice_ID*, *Date*, *Total* and *Rating*) such that:
 - The column that numbers the observations is not displayed;
 - It includes the location of the supermarket in a column to the left of the listing;
 - It only includes observations on sales transactions with a number of products purchased by customer greater than 5;
 - It presents the total price including tax of sales transactions and the total customer satisfaction rating by branch;
 - It includes the branch in the title: *Listing of Sales Transactions for Branch ...*.

EXERCISE 2

Consider the *mydata.adidas_us_sales* data set with sales data of Adidas in United States.

- a) Create a data set named *adidas_us_sales1*, where a new variable named *Category_Gender* is derived from the *Product* variable, containing the first 3 characters.

b) Based on `adidas_us_sales1` produce a listing of the variables *Retailer*, *Invoice_Date*, *Category_Gender* and *Operating_Margin*, applying the following formats:

- `genderf` format, which associates the labels *Male* and *Female* with the values *Men* and *Wom*, respectively, in the *Category_Gender* variable;
- `marginf` format, which associates the labels *Low*, *Medium*, *High* and *Very High* with the intervals `[0%, 20%[`, `[20%, 40%[`, `[40%, 60%[` and `[60%, 100%]`, respectively, based on the values in the *Operating_Margin* variable.

EXERCISE 3

Using the dataset *sales*, create the report shown below:

Sales Figures from the SALES Data Set

Region	Quantity	TotalSales
East	100	699.0
	100	899.0
	500	19995.0
	2	20000.0
East	702	41593.0

Region	Quantity	TotalSales
North	50	449.5
	3	15597.0
	1	5129.0
	5	52.5
	3	15597.0
North	62	36825.0

Region	Quantity	TotalSales
South	100	599.0
	10	299.5
	1	9109.0
	100	1995.0
South	211	12002.5

Region	Quantity	TotalSales
West	50	299.5
	1000	1990.0
West	1050	2289.5
	2025	92710.0
